day06 支付相关

今日概要

- 业务支付相关业务
- 项目开发

内容回顾

- 常鑫,上周内容回顾
 - 。 优惠券
 - 。 定时任务
 - 。 优惠券状态
 - 后台管理
- 运营中心(后台管理) 开发了专场、拍品、图片、规格等管理。
 - o ModelForm、COS图片上传、定制钩子实现图片上传。
 - 处理上传和修改的操作(类型判断)。
 - o datetimepicker时间组件的使用。
 - o celery + redis 实现定时任务。
 - 。 通过js做图片预览 / js FormData 进行文件上传。
- 优惠券
 - 。 后台
 - 对于优惠券管理。
 - o 小程序&api
 - 表结构的设计
 - pass

今日详细

1.支付业务逻辑

• 张达

参考淘宝 & 订单去绑定收获地址

- 收获地址和订单关联
- 优惠券
- 价格处理: 优惠券、保证金、余额/微信支付

• 表结构的设计

-4	A	В	C	D	E	F	G	Н	I	J	K	L	M
	地域 山西-白涛												
	ID	收货人	收获人电话	省	市	县	详细地址	用户ID					
ı													
							Di-						
	订单表						+						
	ID		地址ID	支付金额	支付类型								
L	1			1									
	2		1	1									
3													
4													
5													
6	我的优惠券												
		优惠券ID	状态	订单ID									
3		JUI-133 12	700	1,3 4.12	1								
)			+	+									
)													
L				+									
				-									
3				-			-	+					
	保证金			-				-	扣除保证金表				
	ID ID		金额	剩余金额					ID THRUKULEE AN	订单ID	金额	类型(逾期扣除/支付抵扣)	
5	10		100						10	り年10	五五十二	天主 (超過20日本/文刊 120日)	_
7			100	1000				-	-	 	-		_
			1	+	-					+			_
,					1								_

任务: 根据表同步ORM类(截图发群里) 10:25

```
from django.db import models
class UserInfo(models.Model):
   telephone = models.CharField(verbose_name='手机号', max_length=11)

```

2.项目开发

2.1 任务: 订单列表开发

```
在小程序端,home页面编写点击跳转,指向同一个url+通过get传参到我的订单页面。
   url="/pages/order/order?orderType=3"
在小程序端, 我的订单页面。
   向后台发送ajax请求获取当前用户所有的订单,并根据订单的状态进行结构化处理。
      1:{
         text:'待支付',
         child:[
            \{\ldots\},
         ]
      }
      2:
      3:
      4:
   根据跳转过来时传入的参数orderType=3,进行订单的展示。
   点击根据状态切换订单的展示。
参考上节的示例代码。
```

2.2 订单列表开发

● API, 返回所有的订单。

```
class OrderModelSerializer(serializers.ModelSerializer):
    cover = serializers.CharField(source='item.cover')
    create_date = serializers.DateTimeField(format="%Y-%m-%d %H:%M")
   title = serializers.CharField(source='item.title')
    class Meta:
        model = models.Order
        exclude = ['uid', 'twenty_four_task_id', 'user', 'deposit']
    def text(self,obj):
        # model_to_dict(obj.item,['title','cover'])
        return {
            title:obj.item.title,
            cover:obj.item.cover.name
        }
class OrderView(ListAPIView):
    """ 订单接口 """
   authentication_classes = [UserAuthentication, ]
    # queryset = models.Order.objects.all().order_by('id')
    serializer_class = OrderModelSerializer
   def get_queryset(self):
        return
models.Order.objects.filter(user=self.request.user).order_by('id')
    def list(self, request, *args, **kwargs):
        response = super().list(request, *args, **kwargs)
        if response.status_code != status.HTTP_200_OK:
            return response
        info = OrderedDict()
        for item in models.Order.status_choices:
            info[item[0]] = {'text': item[1], 'child': []}
        for item in response.data:
            info[item['status']]['child'].append(item)
        response.data = info
        return response
```

● 小程序

```
</navigator>
    <navigator class="item" url="/pages/order/order?seleted=2">
     <image src="/static/images/icon/transaction_order2_icon_show.png">
</image>
     <text>待收货</text>
    </navigator>
    <navigator class="item" url="/pages/order/order?seleted=3">
     <image src="/static/images/icon/transaction_order3_icon_show.png">
</image>
     <text>已完成</text>
    </navigator>
    <navigator class="item" url="/pages/order/order?seleted=4">
      <image src="/static/images/icon/transaction_order5_icon_show.png">
</image>
     <text>逾期未支付</text>
    </navigator>
```

```
<view class="container">
  <view class="header">
    <view class="{{ seleted == index? 'active' : '' }}" wx:for="</pre>
{{orderDict}}" wx:key="index" bindtap="changeStatus" data-id="{{index}}">
{{item.text}}</view>
  </view>
  <view class="content">
    <view class="item" wx:for="{{orderDict[seleted].child}}" wx:key="idx"</pre>
bindtap="toPay" data-item="{{item}}">
      <view class="cover">
        <image src="{{item.cover}}"></image>
      </view>
      <view class="info">
        <view class="big">
          <text>{{item.title}}</text>
        </view>
        <view class="small">
          <view>成交额: {{item.price}}</view>
          <view>成交时间: {{item.create_date}}</view>
        </view>
      </view>
    </view>
  </view>
</view>
```

```
// pages/order/order.js
var api = require('../../config/api.js')
var app = getApp();
Page({
```

```
/**
 * 页面的初始数据
 */
data: {
  seleted:null,
 orderDict:{}
},
toPay:function(e){
  var order = e.currentTarget.dataset.item;
  if(order.status != 1){
    return
  }
 wx.navigateTo({url: '/pages/pay/pay?orderId=' + order.id});
},
changeStatus: function (e) {
 var seleted = e.currentTarget.dataset.id;
  this.setData({
    seleted: seleted
 })
},
getOrder:function(){
  var userInfo = app.globalData.userInfo;
 wx.request({
    url: api.Order,
    header: {
      Authorization: userInfo ? "token " + userInfo.token : ""
    },
    method: 'GET',
    dataType: 'json',
    responseType: 'text',
    success: (res) => {
      this.setData({
       orderDict: res.data
      })
    },
    fail: function (res) { },
    complete: function (res) { },
 })
},
/**
 * 生命周期函数--监听页面加载
onLoad: function (options) {
 this.setData({
    seleted:options.seleted
 })
 this.getOrder();
},
```

```
onPullDownRefresh: function () {
  this.getOrder();
 },
})
```

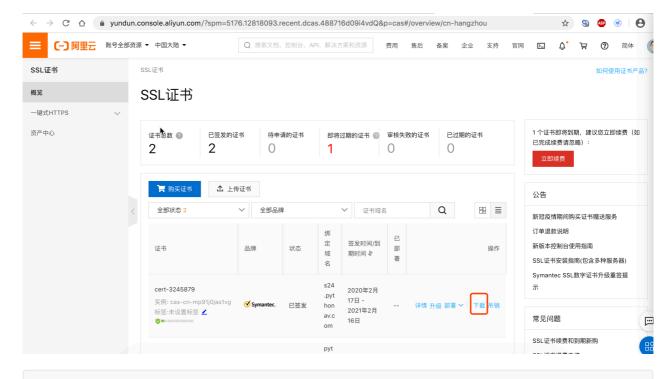

2.3 任务: 支付

点击未支付的订单,显示相关数据并进行支付。

```
- 订单列表页面,点击事件并传入订单ID
- 支付页面,
  接收订单ID,并向后台接口发送request请求获取订单相关信息:拍品、成交、优惠券、保证金、余
- 立即支付
  用户选择的数据发送API
- API,接收到数据之后进行交易
  成交价 - 优惠券 <= 0
  成交价 - 优惠券 - 保证金 = 0
  成交价 - 优惠券 - 保证金 < 0
     抵扣
     退还(判断如果是专场保证金&还有未支付的订单)
  成交价 - 优惠券 - 保证金 > 0
     余额支付
  操作表结构:
     订单表
     我的优惠券
     抵扣记录
     保证金
     退款
     用户表
```

2.4 任务: https证书

阿里云申请免费的https证书 + 云服务器(最好)

https://common-buy.aliyun.com/?

spm=5176.2020520163.cas.1.3c0956a7fVhtqD&commodityCode=cas#/buy

答疑

1.数据库迁移
